

Splunk Dashboard Creation

Proof of Concept — SOC Internship, Splunk Enterprise Evaluation
Extracted from: Splunk Enterprise — Hands-On Evaluation Report | September 17, 2026

1. Objective

A dashboard takes several searches an analyst would otherwise re-run by hand and pins their results as live panels on a single page — built once, then checked at a glance from then on. This document is a focused proof of concept for the dashboard-building capability of Splunk Enterprise, demonstrating two dashboards created during this evaluation: **ssh_logs** and **tunnel logs**. Each consolidates the key metrics from a corresponding log investigation into a single, reusable monitoring view, removing the need to re-run every underlying search individually.

2. Dashboards Created

Both dashboards were built and saved within the Search & Reporting app, and appear alongside Splunk's built-in dashboards in the platform's dashboard listing — confirming they were created and persisted successfully.

☆	Title ↑	Actions	Owner ↕	App ↕	Sharing ↕	Type ↕

App search Schedule Not scheduled. Edit Permissions Private. Owned by admin7. Edit Modified Sep 10, 2026 4:50:52 PM						
> ☆	Integrity Check of Installed Files	Edit	nobody	search	App	Dashboard Studio
> ☆	Job Details Dashboard	Edit	nobody	search	App	Dashboard Studio
> ☆	Orphaned Scheduled Searches, Reports, and Alerts	Edit	nobody	search	App	Dashboard Studio
> ☆	Scheduled export is now available for Dashboard Studio	Edit	nobody	search	Global	Dashboard Studio
> ☆	ssh_logs	Edit	admin7	search	Private	Dashboard Studio
> ☆	tunnel logs	Edit	admin7	search	Private	Dashboard Studio

Figure 1 — *ssh_logs* and *tunnel logs* dashboards listed alongside Splunk's built-in dashboards (*Integrity Check of Installed Files*, *Job Details Dashboard*, etc.), confirming both were built and saved in the Search app.

3. ssh_logs Dashboard

Consolidates the findings of the SSH brute-force investigation into a single view: total event volume split by source vs. destination IPs, the top source IPs ranked by event count and unique destinations reached, and a supporting stats table breaking down failed, successful, and undetermined login attempts per attacker–victim pair.

Figure 2 — ssh_logs dashboard: total event volume by source vs. destination IPs, top source IPs ranked by event count and unique destinations reached, and a stats table of failures / successes / undetermined attempts per attacker–victim pair.

4. tunnel logs Dashboard

Consolidates the findings of the Teredo tunnel scanning investigation into a single view: an area chart of events and unique targets by source host, the underlying raw event detail for drill-down, and a bubble chart comparing source IPs by scanning volume.

Figure 3 — tunnel logs dashboard: area chart of events and unique targets by source host, underlying raw event detail, and a bubble chart comparing source IPs by scanning volume.

5. Summary

Both dashboards demonstrate the same core capability — turning a set of individually-run investigative searches into a persistent, at-a-glance monitoring view. Rather than re-running each SPL query from the

underlying investigations by hand, the key metrics (event volume, top talkers, unique targets, and success/failure breakdowns) are pinned as live panels that refresh automatically. Full SPL queries, raw evidence, and the finalization/verdict for each underlying investigation are documented separately in their respective POC reports (SSH Log POC and Tunnel Log POC).
